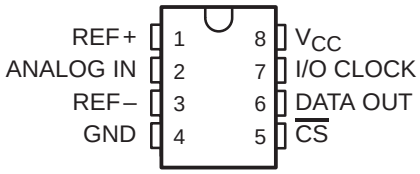
(TOP VIEW)



description

The TLC548 and TLC549 are CMOS analog-to-digital converter (ADC) integrated circuits built around an 8-bit switched-capacitor successive-approximation ADC. These devices are designed for serial interface with a microprocessor or peripheral through a 3-state data output and an analog input. The TLC548 and TLC549 use only the input/output clock (I/O CLOCK) input along with the chip select ($\overline{CS}$) input for data control. The maximum I/O CLOCK input frequency of the TLC548 is 2.048 MHz, and the I/O CLOCK input frequency of the TLC549 is specified up to 1.1 MHz.

AVAILABLE OPTIONS

	SMALL OUTLINE (D)	PLASTIC DIP (P)
0°C to 70°C	TLC548CD TLC549CD	TLC548CP TLC549CP
–40°C to 85°C	TLC548ID TLC549ID	TLC548IP TLC549IP

description (continued)

Operation of the TLC548 and the TLC549 is very similar to that of the more complex TLC540 and TLC541 devices; however, the TLC548 and TLC549 provide an on-chip system clock that operates typically at 4 MHz and requires no external components. The on-chip system clock allows internal device operation to proceed independently of serial input/output data timing and permits manipulation of the TLC548 and TLC549 as desired for a wide range of software and hardware requirements. The I/O CLOCK together with the internal system clock allow high-speed data transfer and conversion rates of 45 500 conversions per second for the TLC548, and 40 000 conversions per second for the TLC549.

Additional TLC548 and TLC549 features include versatile control logic, an on-chip sample-and-hold circuit that can operate automatically or under microprocessor control, and a high-speed converter with differential high-impedance reference voltage inputs that ease ratiometric conversion, scaling, and circuit isolation from logic and supply noises. Design of the totally switched-capacitor successive-approximation converter circuit allows conversion with a maximum total error of ±0.5 least significant bit (LSB) in less than 17 μs.

The TLC548C and TLC549C are characterized for operation from 0°C to 70°C. The TLC548I and TLC549I are characterized for operation from –40°C to 85°C.

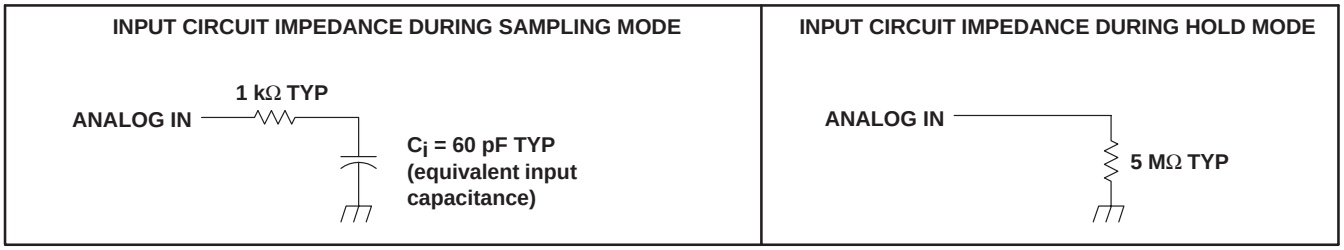
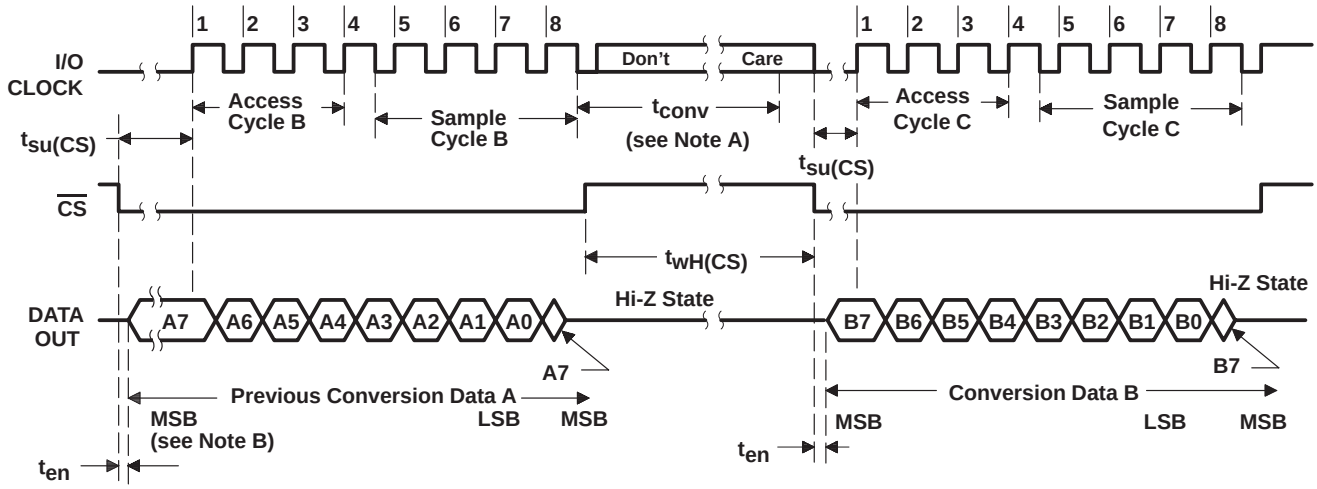
typical equivalent inputs



operating sequence



NOTES: A. The conversion cycle, which requires 36 internal system clock periods (17 µs maximum), is initiated with the eighth I/O clock pulse trailing edge after $\overline{CS}$ goes low for the channel whose address exists in memory at the time.

B. The most significant bit (A7) is automatically placed on the DATA OUT bus after $\overline{CS}$ is brought low. The remaining seven bits (A6–A0) are clocked out on the first seven I/O clock falling edges. B7–B0 follows in the same manner.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)

Supply voltage, V_{CC} (see Note 1)		6.5 V
Input voltage range at any input		–0.3 V to V_{CC} + 0.3 V
Output voltage range		–0.3 V to V_{CC} + 0.3 V
Peak input current range (any input)		±10 mA
Peak total input current range (all inputs)		±30 mA
Operating free-air temperature range, T_A (see Note 2):	TLC548C, TLC549C	0°C to 70°C
	TLC548I, TLC549I	–40°C to 85°C
Storage temperature range, T_{stg}		–65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds		260°C

NOTES: 1. All voltage values are with respect to the network ground terminal with the REF– and GND terminals connected together, unless otherwise noted.

2. The D package is not recommended below –40°C.

recommended operating conditions

	TLC548			TLC549			UNIT
	MIN	NOM	MAX	MIN	NOM	MAX	
Supply voltage, V_{CC}	3	5	6	3	5	6	V
Positive reference voltage, V_{ref+} (see Note 3)	2.5	V_{CC}	V_{CC}+0.1	2.5	V_{CC}	V_{CC}+0.1	V
Negative reference voltage, V_{ref-} (see Note 3)	–0.1	0	2.5	–0.1	0	2.5	V
Differential reference voltage, V_{ref+}, V_{ref-} (see Note 3)	1	V_{CC}	V_{CC}+0.2	1	V_{CC}	V_{CC}+0.2	V
Analog input voltage (see Note 3)	0		V_{CC}	0		V_{CC}	V
High-level control input voltage, V_{IH} (for V_{CC} = 4.75 V to 5.5 V)	2			2			V
Low-level control input voltage, V_{IL} (for V_{CC} = 4.75 V to 5.5 V)			0.8			0.8	V
Input/output clock frequency, $f_{clock(I/O)}$ (for V_{CC} = 4.75 V to 5.5 V)	0		2.048	0		1.1	MHz
Input/output clock high, $t_{wH(I/O)}$ (for V_{CC} = 4.75 V to 5.5 V)	200			404			ns
Input/output clock low, $t_{wL(I/O)}$ (for V_{CC} = 4.75 V to 5.5 V)	200			404			ns
Input/output clock transition time, $t_{t(I/O)}$ (for V_{CC} = 4.75 V to 5.5 V) (see Note 4 and Operating Sequence)			100			100	ns
Duration of $\overline{CS}$ input high state during conversion, $t_{wH(CS)}$ (for V_{CC} = 4.75 V to 5.5 V) (see Operating Sequence)	17			17			µs
Setup time, $\overline{CS}$ low before first I/O CLOCK, $t_{su(CS)}$ (for V_{CC} = 4.75 V to 5.5 V) (see Note 5)	1.4			1.4			µs
TLC548C, TLC549C	0		70	0		70	°C
TLC548I, TLC549I	–40		85	–40		85	°C

NOTES: 3. Analog input voltages greater than that applied to REF+ convert to all ones (11111111), while input voltages less than that applied to REF– convert to all zeros (00000000). For proper operation, the positive reference voltage V_{ref+}, must be at least 1 V greater than the negative reference voltage, V_{ref-}. In addition, unadjusted errors may increase as the differential reference voltage, $V_{ref+} - V_{ref-}$, falls below 4.75 V.

4. This is the time required for the I/O CLOCK input signal to fall from V_{IH} min to V_{IL} max or to rise from V_{IL} max to V_{IH} min. In the vicinity of normal room temperature, the devices function with input clock transition time as slow as 2 µs for remote data acquisition applications in which the sensor and the ADC are placed several feet away from the controlling microprocessor.

5. To minimize errors caused by noise at the $\overline{CS}$ input, the internal circuitry waits for two rising edges and one falling edge of internal system clock after $\overline{CS}\downarrow$ before responding to control input signals. This $\overline{CS}$ setup time is given by the t_{en} and $t_{su(CS)}$ specifications.

electrical characteristics over recommended operating free-air temperature range, $V_{CC} = V_{ref+} = 4.75$ V to 5.5 V, $f_{clock(I/O)} = 2.048$ MHz for TLC548 or 1.1 MHz for TLC549 (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP†	MAX	UNIT
V_{OH}	High-level output voltage		V_{CC} = 4.75 V, I_{OH} = –360 µA	2.4			V
V_{OL}	Low-level output voltage		V_{CC} = 4.75 V, I_{OL} = 3.2 mA			0.4	V
I_{OZ}	High-impedance off-state output current		$V_O = V_{CC}$, $\overline{CS}$ at V_{CC}			10	µA
			V_O = 0, $\overline{CS}$ at V_{CC}			–10	
I_{IH}	High-level input current, control inputs		$V_I = V_{CC}$		0.005	2.5	µA
I_{IL}	Low-level input current, control inputs		V_I = 0		–0.005	–2.5	µA
$I_{I(on)}$	Analog channel on-state input current during sample cycle		Analog input at V_{CC}		0.4	1	µA
			Analog input at 0 V		–0.4	–1	
I_{CC}	Operating supply current		$\overline{CS}$ at 0 V		1.8	2.5	mA
$I_{CC} + I_{ref}$	Supply and reference current		$V_{ref+} = V_{CC}$		1.9	3	mA
C_i	Input capacitance	Analog inputs			7	55	pF
		Control inputs			5	15	

operating characteristics over recommended operating free-air temperature range, $V_{CC} = V_{ref+} = 4.75$ V to 5.5 V, $f_{clock(I/O)} = 2.048$ MHz for TLC548 or 1.1 MHz for TLC549 (unless otherwise noted)

PARAMETER		TEST CONDITIONS	TLC548			TLC549			UNIT

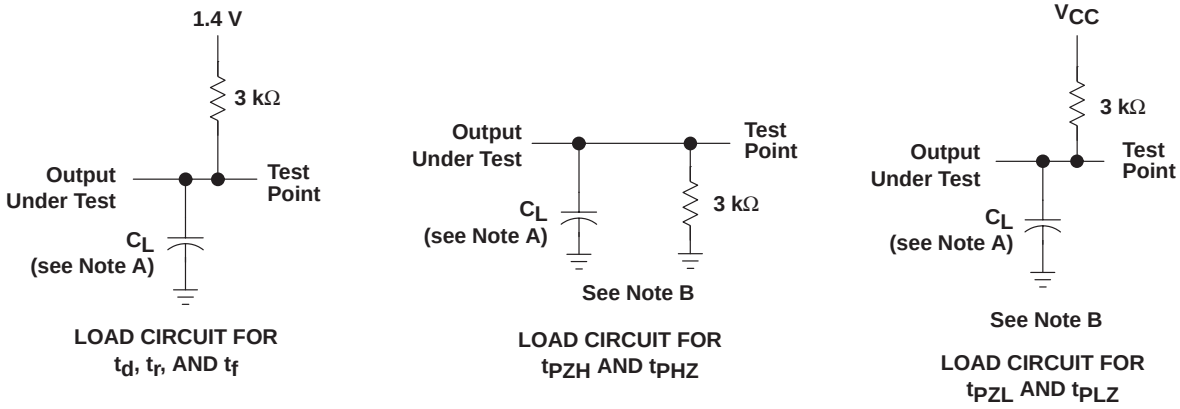
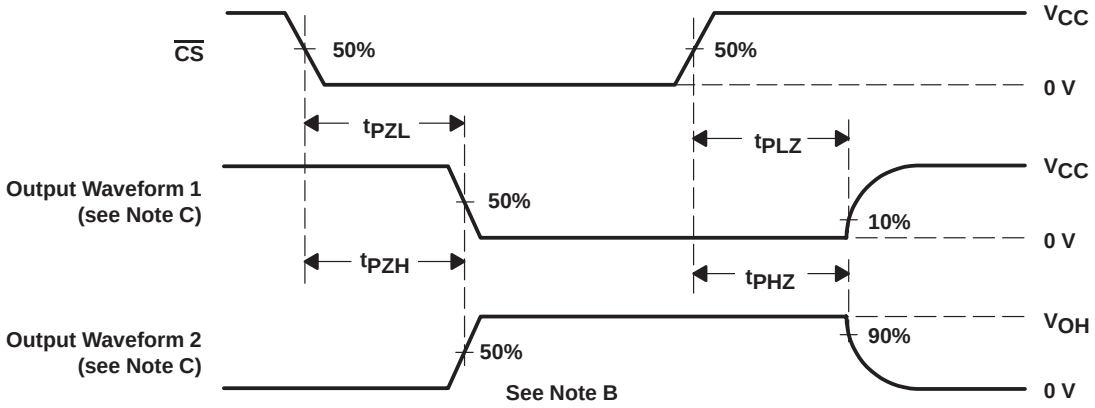
t_d	Delay time to data output valid	I/O CLOCK↓			200			400	ns
t_{en}	Output enable time				1.4			1.4	µs
t_{dis}	Output disable time	See Figure 1			150			150	ns
$t_{r(bus)}$	Data bus rise time				300			300	ns
$t_{f(bus)}$	Data bus fall time				300			300	ns

† All typicals are at V_{CC} = 5 V, T_A = 25°C.

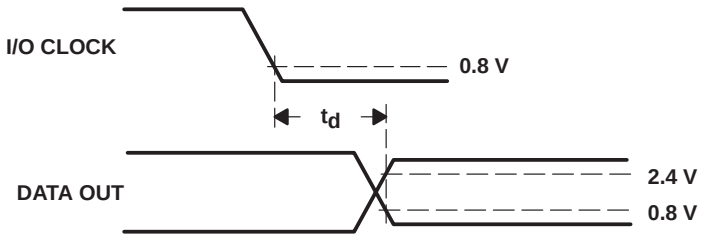
NOTES: 6. Linearity error is the deviation from the best straight line through the A/D transfer characteristics.
7. Zero-scale error is the difference between 00000000 and the converted output for zero input voltage; full-scale error is the difference between 11111111 and the converted output for full-scale input voltage.
8. Total unadjusted error is the sum of linearity, zero-scale, and full-scale errors.

PARAMETER MEASUREMENT INFORMATION





VOLTAGE WAVEFORMS FOR ENABLE AND DISABLE TIMES



VOLTAGE WAVEFORMS FOR DELAY TIME

VOLTAGE WAVEFORMS FOR RISE AND FALL TIMES

NOTES: A. C_L = 50 pF for TLC548 and 100 pF for TLC549; C_L includes jig capacitance.
B. $t_{en} = t_{PZH}$ or t_{PZL}, $t_{dis} = t_{PHZ}$ or t_{PLZ}.
C. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.

Figure 1. Load Circuits and Voltage Waveforms

APPLICATIONS INFORMATION

simplified analog input analysis

Using the equivalent circuit in Figure 2, the time required to charge the analog input capacitance from 0 to V_S within 1/2 LSB can be derived as follows:

The capacitance charging voltage is given by

$$V_C = V_S \left(1 - e^{-t_c/R_t C_i}\right) \quad (1)$$

where

$$R_t = R_S + r_i$$

The final voltage to 1/2 LSB is given by

$$V_C \text{ (1/2 LSB)} = V_S - (V_S/512) \quad (2)$$

Equating equation 1 to equation 2 and solving for time t_c gives

$$V_S - (V_S/512) = V_S \left(1 - e^{-t_c/R_t C_i}\right) \quad (3)$$

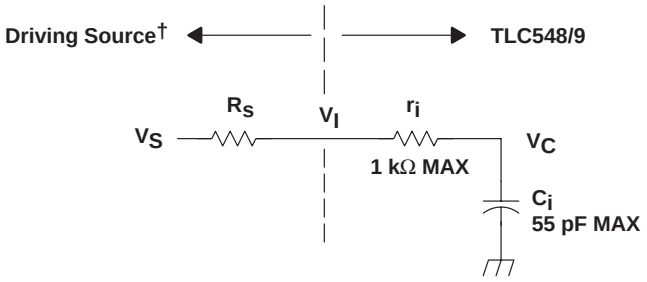
and

$$t_c \text{ (1/2 LSB)} = R_t \times C_i \times \ln(512) \quad (4)$$

Therefore, with the values given the time for the analog input signal to settle is

$$t_c \text{ (1/2 LSB)} = (R_S + 1\ \text{k}\Omega) \times 60\ \text{pF} \times \ln(512) \quad (5)$$

This time must be less than the converter sample time shown in the timing diagrams.



V_I = Input Voltage at ANALOG IN
V_S = External Driving Source Voltage
R_S = Source Resistance
r_i = Input Resistance
C_i = Input Capacitance

† Driving source requirements:

- Noise and distortion for the source must be equivalent to the resolution of the converter.
- R_S must be real at the input frequency.

Figure 2. Equivalent Input Circuit Including the Driving Source

PRINCIPLES OF OPERATION

The TLC548 and TLC549 are each complete data acquisition systems on a single chip. Each contains an internal system clock, sample-and-hold function, 8-bit A/D converter, data register, and control logic circuitry. For flexibility and access speed, there are two control inputs: I/O CLOCK and chip select ($\overline{CS}$). These control inputs and a TTL-compatible 3-state output facilitate serial communications with a microprocessor or minicomputer. A conversion can be completed in 17 μs or less, while complete input-conversion-output cycles can be repeated in 22 μs for the TLC548 and in 25 μs for the TLC549.

The internal system clock and I/O CLOCK are used independently and do not require any special speed or phase relationships between them. This independence simplifies the hardware and software control tasks for the device. Due to this independence and the internal generation of the system clock, the control hardware and software need only be concerned with reading the previous conversion result and starting the conversion by using the I/O clock. In this manner, the internal system clock drives the “conversion crunching” circuitry so that the control hardware and software need not be concerned with this task.

When $\overline{CS}$ is high, DATA OUT is in a high-impedance condition and I/O CLOCK is disabled. This $\overline{CS}$ control function allows I/O CLOCK to share the same control logic point with its counterpart terminal when additional TLC548 and TLC549 devices are used. This also serves to minimize the required control logic terminals when using multiple TLC548 and TLC549 devices.

The control sequence has been designed to minimize the time and effort required to initiate conversion and obtain the conversion result. A normal control sequence is:

1. $\overline{CS}$ is brought low. To minimize errors caused by noise at $\overline{CS}$, the internal circuitry waits for two rising edges and then a falling edge of the internal system clock after a $\overline{CS}\downarrow$ before the transition is recognized. However, upon a $\overline{CS}$ rising edge, DATA OUT goes to a high-impedance state within the specified t_{dis} even though the rest of the integrated circuitry does not recognize the transition until the specified $t_{su(CS)}$ has elapsed. This technique protects the device against noise when used in a noisy environment. The most significant bit (MSB) of the previous conversion result initially appears on DATA OUT when $\overline{CS}$ goes low.
2. The falling edges of the first four I/O CLOCK cycles shift out the second, third, fourth, and fifth most significant bits of the previous conversion result. The on-chip sample-and-hold function begins sampling the analog input after the fourth high-to-low transition of I/O CLOCK. The sampling operation basically involves the charging of internal capacitors to the level of the analog input voltage.
3. Three more I/O CLOCK cycles are then applied to the I/O CLOCK terminal and the sixth, seventh, and eighth conversion bits are shifted out on the falling edges of these clock cycles.
4. The final (the eighth) clock cycle is applied to I/O CLOCK. The on-chip sample-and-hold function begins the hold operation upon the high-to-low transition of this clock cycle. The hold function continues for the next four internal system clock cycles, after which the holding function terminates and the conversion is performed during the next 32 system clock cycles, giving a total of 36 cycles. After the eighth I/O CLOCK cycle, $\overline{CS}$ must go high or the I/O clock must remain low for at least 36 internal system clock cycles to allow for the completion of the hold and conversion functions. $\overline{CS}$ can be kept low during periods of multiple conversion. When keeping $\overline{CS}$ low during periods of multiple conversion, special care must be exercised to prevent noise glitches on the I/O CLOCK line. If glitches occur on I/O CLOCK, the I/O sequence between the microprocessor/controller and the device loses synchronization. When $\overline{CS}$ is taken high, it must remain high until the end of conversion. Otherwise, a valid high-to-low transition of $\overline{CS}$ causes a reset condition, which aborts the conversion in progress.

A new conversion may be started and the ongoing conversion simultaneously aborted by performing steps 1 through 4 before the 36 internal system clock cycles occur. Such action yields the conversion result of the previous conversion and not the ongoing conversion.

PRINCIPLES OF OPERATION

For certain applications, such as strobing applications, it is necessary to start conversion at a specific point in time. This device accommodates these applications. Although the on-chip sample-and-hold function begins sampling upon the high-to-low transition of the fourth I/O CLOCK cycle, the hold function does not begin until the high-to-low transition of the eighth I/O CLOCK cycle, which should occur at the moment when the analog signal must be converted. The TLC548 and TLC549 continue sampling the analog input until the high-to-low transition of the eighth I/O CLOCK pulse. The control circuitry or software then immediately lowers I/O CLOCK and starts the holding function to hold the analog signal at the desired point in time and starts the conversion.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
